How to Transfer Files between two PCs using LAN/Ethernet Cable?

HacK_MiNDeD (http://www.hackerslane.com/author/hack_minded/) December 3, 2010

32 Comments (http://www.hackerslane.com/2010/how-to-transfer-files-between-two-pcs-using-lanethernet-cable/#comments)

Sharing large amounts of data with your friends can really be a hassle if you don't know of efficient and easy ways to do it. One way is you can use an external storage medium such as an external HDD, USB, etc. This way is convenient for most of us, best for the average users, regardless of the fact that it drains 50% of our precious time in the process. Think about it. first you've to copy files to the external media and then copy it again from there to another computer. Isn't that a waste of time clearly? Here's when you've to look for alternatives if you treasure your time. The best way would be the one which would consume the least time, and must be easy to get along with. This is only possible when you **directly** transfer file to the another Computer, eliminating the need of a third media.

Windows comes along with built-in File Sharing feature that can be used to share data throughout your network. Don't worry if you don't have a network, you can use this feature even by easily linking two computers via a LAN cable, or in other words, by networking two Computers.

This tutorial is really easy to follow and will help you in getting started with LAN file transfers in no time.

Things You Will Require

- Ethernet/LAN cable (technical name: RJ45/8P8C)

LAN Cable RJ45/8P8C

- Two Computers with Ethernet/LAN ports.

LAN Port

How to get things done?

- Start up both the computers. You know you have to do this.
- Network two of them with the LAN Cable. I mean to say, insert the jack of one end into one of the Computers, and obviously, the other goes into the second Computer.

Sharing Options

- You will see that both the Computers will recognize an unknown LAN network. Go to “Network & Sharing Center” and Enable File Sharing.
- Go to “Network” (or “View Network Connections” on older versions of Windows).

Network

- You’d find the networked PC listed over there. Open it, and enter the Username and Password of the **other** Computer you’re trying to connect to.

For you to be able to connect to another PC, it is necessary that the User Account on the other PC has a password set.

Find Component Inventory
Fast search 10M components 100s mfg Price, inventory, trending & more.

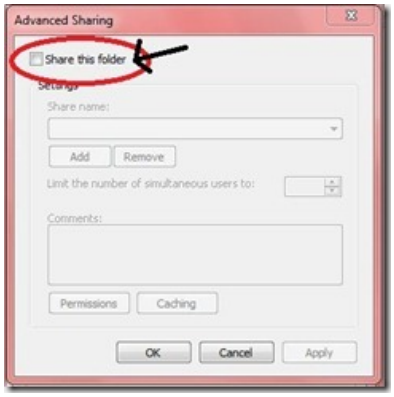
Now you can view the Shared Folders of that Computer to which you’re connected.

How to share Folders over the network?

- Right-click on the Folder and open “Properties”, browse over to the “Sharing” tab and click on the “Advanced Sharing” button.

Folder Properties

- In the “Advanced Sharing” dialogue box, Check the “Share this folder” option. Click “Apply” and then “Ok”. This may take some time if you have a large number of files in that folder, just be patient.



Advanced Sharing

You now know how to share a Folder as well as how to connect two computers to a Network and enable sharing. This is how you can easily drag and drop files between two computers and save yourself from bugging data transfers. Hope you liked this tutorial, if you have any queries, don’t hesitate to drop comments below. 😊

Remark: It’s a good measure to disable sharing of folders once you’re done with your work. I once forgot to do this after returning from a friend’s house and realized that my neighbors at my local network had access to my files, which they shouldn’t.

Thanks for this, saved me a TON of time. I was trying to transfer about 60 GB of data over wifi and it was taking forever, only going about 3mb per second. I hooked up the ethernet cables and tranferred at 60mb per second.

There are 2 types of vables available in market…..
You should use crossover cable….
Some devices do not convert automatically..
This is the point where i failed..
